During an ongoing research programme on *Saissetia oleae* (Oliv.) (Homoptera: Coccoidea) and its parasites on the island of Corfu, the presence of the hyperparasite *Cheiloneurus claviger* (Thomson) (Hymenoptera: Encyrtidae) was recorded, for the first time, in samples of parasitized *Saissetia oleae* in 1991. The identification of *C. claviger* was made by the junior author.

The adults of *Cheiloneurus claviger* emerged from *S. oleae* females parasitized by *Metaphycus lounsburyi* (How.) (Hymenoptera: Encyrtidae), after they were placed in plastic capsules. Tables 1 and 2 give the number of adults of *S. oleae*, *C. claviger* and *M. lounsburyi* that emerged from *S. oleae* at two experimental fields. *M. lounsburyi* is one of the main parasitoids of *S. oleae* acting as an internal parasite of the fourth larval instar. The numbers of *C. claviger* emerged were very low compared with the numbers of *M. lounsburyi*, indicating that at present *C. claviger* is not a serious limiting factor for the population of *M. lounsburyi*.

Male and female adults and the scutellum of a female, are shown in Fig. 1. The presence of a group of coarse bristles at the apex of the scutellum and the long marginal vein of fore wings are

the peculiarities of the genus *Cheiloneurus*. The incomplete infuscation of the fore wings and the colour of the antennae with only the 5th funicular segment blackish can easily allow the discrimination of *C. claviger* females from those of congeneric species.

Cheiloneurus claviger is reported as a hyperparasitoid of several coccids of economic import-

tance mainly via other encyrtid parasitoids (Trjapitzin, 1989). In Italy, *C. claviger* has been found to act as a hyperparasite of Kermesidae (genus *Kermes*) which infest Pinoideae (Guerrieri and Viggiani 1990). Previous reports on the entomophagous fauna of *S. oleae* on Corfu do not include *C. claviger* (Viggiani et al. 1975, Tzoras et al., 1979) and it is assumed that the hyperparasitoid has been introduced rather recently. The actual role on the parasitic complex of *S. oleae* and the distribution of this hyperparasite on the island should be further investigated.

Acknowledgments

We wish to thank Mr. D. Kassimis, Director of the Olive Institute for helping to make slides, Dr. A. Mesimeris for helping in the preparation of the manuscript and Mrs E. Vergu for helping in examining the samples.

ΠΕΡΙΛΗΨΗ

Αναφέρεται για πρώτη φορά στην Κέρκυρα η παρουσία του *Cheiloneurus claviger* (Thomson) (Hymenoptera: Encyrtidae) υπεροπαράσιτου του *Saissetia oleae* (Oliv.) (Homoptera: Coccidae). Αχμαία του *C. claviger* εξήλθαν την περίοδο Ιουνίου-Ιουλίου από θηλυκά του *S. oleae* που είχαν παρασιτούσει από το *Metaphycus lounsburyi* (Hymenoptera: Encyrtidae). Προς το παρόν, το υπεροπαράσιτο αντό δεν φαίνεται να αποτελεί σημαντικό περιοριστικό παράγοντα για τον πληθυσμό του *M. lounsburyi* που είναι ένα από τα κυριότερα παράσιτα του *S. oleae*. Δίνονται μορφολογικά στοιχεία για την αναγνώριση του και βιβλιογραφικά δεδομένα για την υπεροπαρασιτική του δράση σε άλλα κοκκοειδή.
